- Turnover data..... 2

## **Storage Data / Transparency**

All relevant data according to the European Guidelines for Good Practice for Storage System Operators, GGPSSO, for the natural gas storage facilities offered by Uniper Energy Storage GmbH may be consulted by any party on the storage portal.

## **Available / booked storage capacities**

You can view the technically maximum available firm and interruptible storage capacities for each storage facility on the storage portal under the "Technical Data" option. You can review all relevant stored data such as the maximum available working gas capacity, the filling and withdrawal rate, average calorific values of the working gas and the name of the storage connection point to a given transmission network. Currently available firm and interruptible capacities are displayed for a selected period when you click the "Bookable storage capacities" button.

## **Planned non-availabilities**

Non-availabilities due to planned maintenance for the current storage year can be found in the storage portal under Maintenance times.

## **Turnover data**

The switch to the usage of individual storage facilities means that the current filling levels and the injection and withdrawal rates are now displayed in the storage portal separately for each storage facility. All data gathered from now on will be archived for five years and can be consulted retrospectively.
